HYGIENIC ENCLOSURE

Make Your Vacuum Pumps Food Proof

Food Safety is essential for the food market. Typically food **producers & processors** frequently (e.g. daily) **disinfect their installations & machines**, just **to guarantee a high Food Safety level.** Vacuum pumps are mainly built-in or installed next to the machinery and that's with only poor or even no protection at all. **Most vacuum pumps can not cope with daily washdowns** (especially with aggressive cleaning media), these result in corroded vacuum pumps, reduced life cycles or even increased risks of (in)direct food pollution.

To avoid this, **Leybold has developed** a range of **Stainless Steel Hygienic Enclosures.** These enclosures are designed **in line with the basic Hygienic Principles** (e.g. a sloped roof) and add the following key features to the vacuum pumps:

ROBUST

By combining Leybold vacuum pumps with the Hygienic Enclosures, highly robust solutions are created for the most challenging food applications and environments. Even for daily washdowns with the most aggressive industrial cleaners. The different Hygienic Enclosures are tailor made and qualified for a dedicated maximal ambient temperature.

PERFORMANCE ORIENTATED

Hygienic Enclosures make it feasible to locate vacuum pumps close to the vacuum demanding machinery. This leads directly towards an increased vacuum performance by avoiding pumping speed losses over the piping. This results in fast process cycles and a better product quality.

COST EFFECTIVE

Hygienic Enclosures do not only make expensive piping obsolete. They are also delivered as a first in class Do It Yourself kit, and designed, so that a single worker can easily install them. These features make the Hygienic Enclosures the most cost-effective solution!
